REMINDERS

- Homework Due Friday 5/29th
- No Test
- iPads FULLY CHARGED

The Heart

Function of the Heart

The human heart is an organ with a very important job! The heart pumps blood through your body. This blood carries all of the oxygen and nutrients that your body needs. The heart pumps blood to every part of the body and never stops beating. Blood leaves the heart through small tubes called *arteries*. After the blood has traveled through your body it comes back into the heart through *veins*.

Heart Description

Your heart is a muscle that is located in your chest. It is protected by the bones in your rib cage. Your heart is about the same size as your fist. The human heart has 4 parts called the 4 *chambers*.

Did You Know?

Your heart beats more than 100,000 times everyday!

Caring for your Heart

It is very important to keep your heart healthy. You can keep your heart healthy by eating healthy foods and exercising. When you exercise your heart beats fast and works harder. This helps it to become stronger.

Name _____ Date _____

Human Body Organs

The Heart

What is the heart's function? _____

Why is it important that the heart pumps blood to every part of the body?

What body part protects the heart? _____

Why is exercising good for your heart? _____

How are arteries and veins similar?

How are arteries and veins different?

How big is your heart? _____
